Diyaliz Hastalarında Oral Antikoagülan ve Antiagregan Tedavi

Doç. Dr. Emre Tutal
Başkent Üniversitesi
Nefroloji BD

- **Antikoagülan tedavi**
  - **Warfarin**
  - **Dabigatran**
- **Antiagregan tedavi**
  - **Asetilsalisilik asit**
  - **Klopidogrel**

Diyaliz hastasında AA/AK tedavi

- **Endikasyonlar**
  - **Genel endikasyonlar**
    - **Atrial fibrilasyon**
    - **Venöz ya da arteryal trombotik hadiseler**
    - **Serebrovasküler olay**
  - **Özel endikasyonlar**
    - **AVF ya da kateter korunması**

KBY hastalarında tromboz eğilimi

- Biyokimyasal
  - Artmış prokoagülan faktörler (vWf)
  - Artmış pıhtılaşma faktör işaretçi düzeyleri (D-dimer)
  - Azalmış endojen antikoagülanlar (Antitrombin, protein c-s)
  - Azalmış fibrinolitik aktivite (plazminojen, tPA)
- Klinik
  - Artmış arterial vasküler hastalık
  - İmmobilite
  - rHuEPO kullanımı

REVIEW

Warfarin in haemodialysis patients with atrial fibrillation: what benefit?

Felix Yang[1]*, Denise Chou[2], Paul Schweitzer[3], and Sam Hanon[3]

[1]Division of Cardiology/Arrhythmia Offices Former 2, Department of Medicine, Montefiore Medical Center, 111 E. 210th Street, Bronx, NY 10467, USA; [2]Department of Neurology, New York Presbyterian Hospital—Cornell, New York, NY, USA; and [3]Division of Cardiology, Department of Medicine, Beth Israel Medical Center, New York, NY, USA

Received 24 July 2010; accepted after revision 19 September 2010; online publish-ahead-of-print 2 November 2010

Warfarin Farmakokinetiği

- **Dar terapötik indeks, çok sayıda ilaç ve yiyecek etkileşimi**
- **GFR < 30 mL/dk/1.73 m2 durumunda ciddi doz azaltılma gerekliliği**
- **Esas olarak karaciğer metabolizması (CYP P-450)**
- **KBY'de KC cytochrome P-450 aktivitesi %45-80 oranında azalabilir**
- **Benzer dozlarda plazma düzeyi x 1.5 artar**

- **Hemodiyaliz hastalarında kanama riski tromboz riskine göre daha fazladır? (Iseki et al. Kidney Int. 1993)**
  - **1609 diyaliz hastasının 4 yıllık takibinde**
    - **Serebral kanama riski x 10.7**
    - **Subaraknoid kanama riski x 4 kat daha fazla**
    - **Tüm vakalar beklenenden 10 ortalama 10 yıl önce gerçekleşiyor**

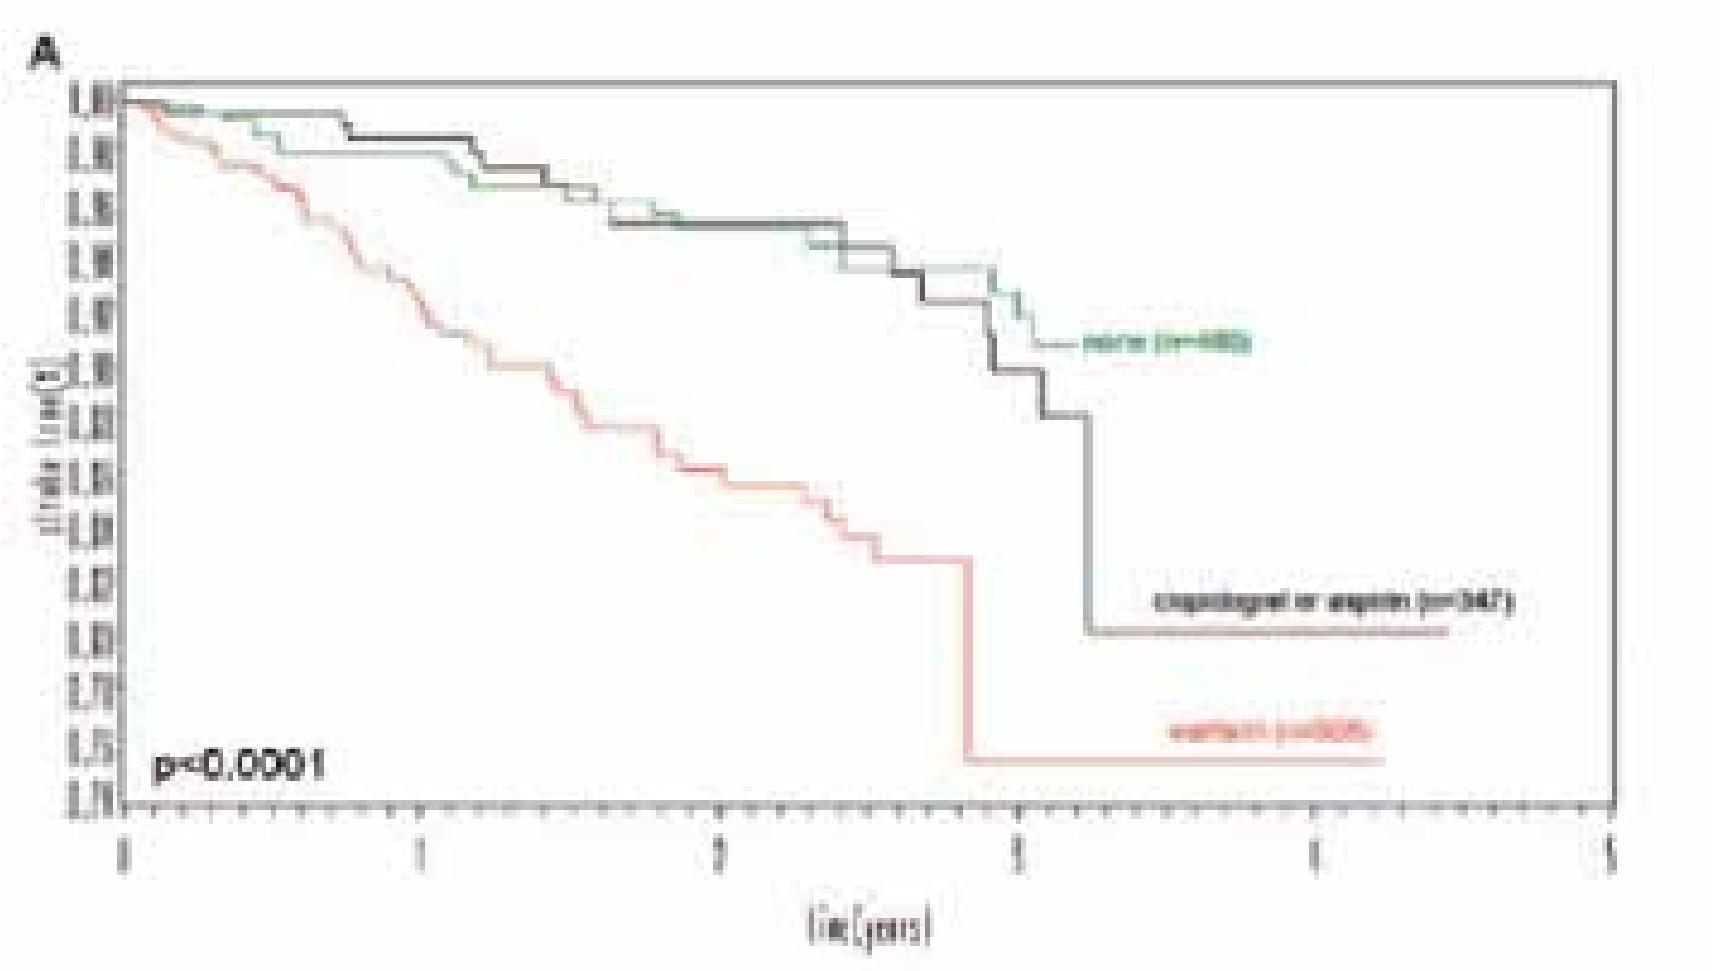
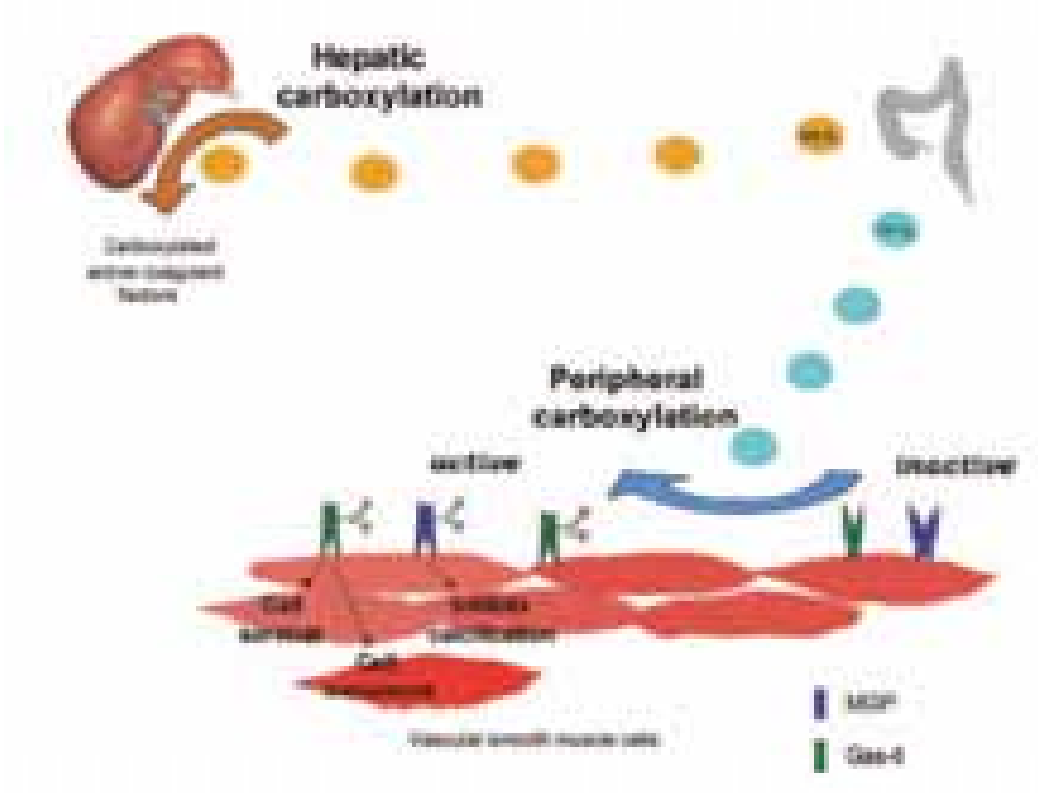
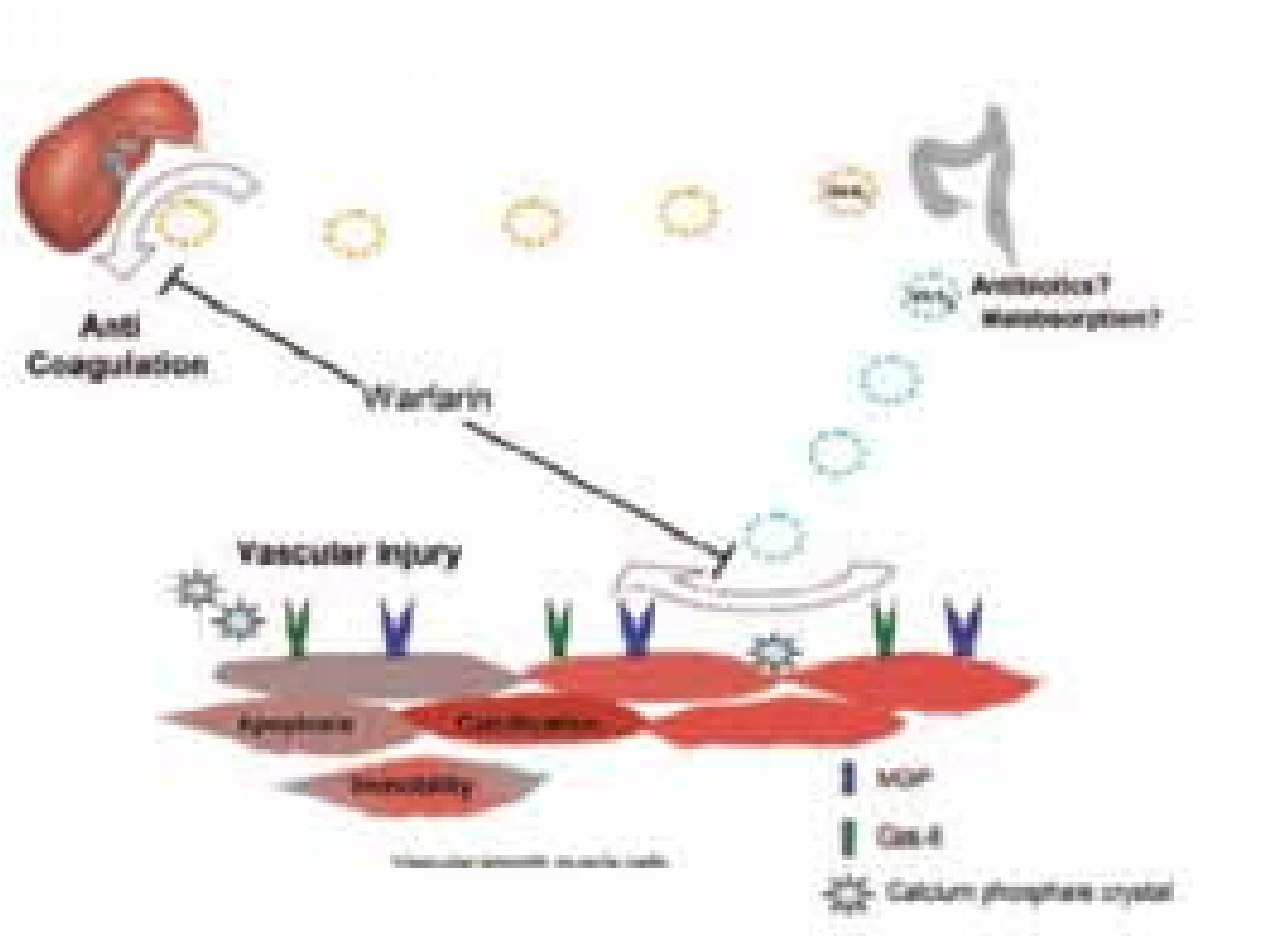
Warfarin Use Associates with Increased Risk for Stroke in Hemodialysis Patients with Atrial Fibrillation



Warfarine bağlı kalsifikasyon ve kalşifilaksi



Normal koşullarda inaktif MGP ve Gas-6 proteinleri vit K bağımlı olarak karboksile edilir ve aktive hale geçerek kalsifikasyonu engeller



Antibiyotikler, diyet kısıtlamaları, malabsorbsyon ve warfarin kullanımı vitamin K sunumunu azaltarak MGP ve Gas-6 aktivasyonunu inhibe eder

KBY hastalarında OAK kullanım önerileri

- OAK lehine
  - > 75 yaş ve eşlik eden risk faktörleri (DM, HT, KKY)
  - TIA ya da inme
  - Atrial trombüs varlığı
  - Hasta tercihi
  - CHADS2 skoru > 2
  - Mitral darlık
  - Prostetik kalp kapağı
- OAK aleyhine
  - < 65 yaş ve risk faktörü yok
  - Kontrolsüz hipertansiyon
  - Antiagregan kullanımı
  - Kalşifilaksi varlığı ya da öyküsü
  - Yaygın kalsifikasyonlar
  - Malnütrisyon
  - Kanama öyküsü
  - Sık düşme öyküsü

Effect of Dipyridamole plus Aspirin on Hemodialysis Graft Patency

N ENGL J MED 360;21 NEJM.ORG MAY 21, 2009

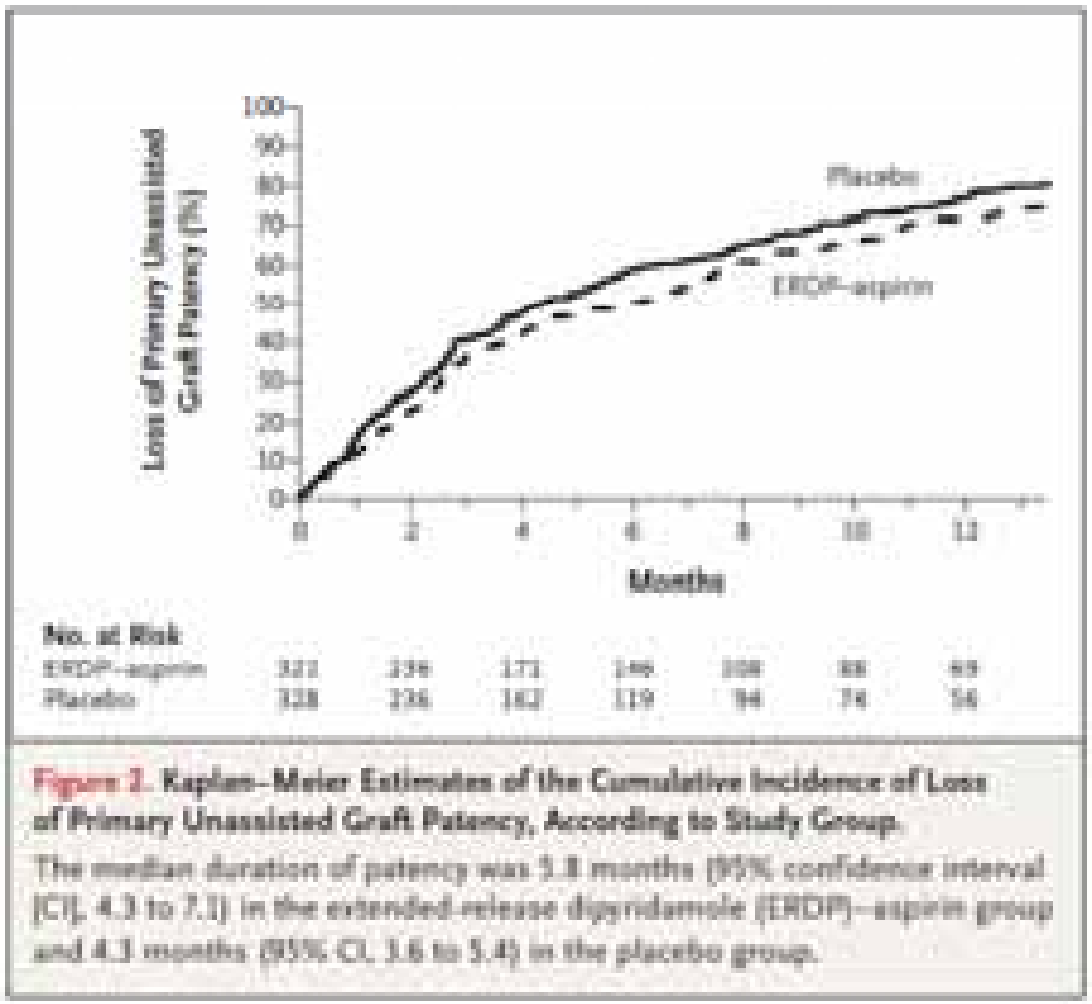

Figure 2. Kaplan–Meier Estimates of the Cumulative Incidence of Loss of Primary Unassisted Graft Patency, According to Study Group.

The median duration of patency was 5.8 months (95% confidence interval [CI], 4.3 to 7.1) in the extended-release dipyridamole (ERDP)–aspirin group and 4.3 months (95% CI, 3.6 to 5.4) in the placebo group.

4.5 years, with 6 additional months of follow-up. The incidence of primary unassisted patency at 1 year was 23% (95% confidence interval [CI], 18 to 28) in the placebo group and 28% (95% CI, 23 to 34) in the dipyridamole–aspirin group, an absolute difference of 5 percentage points. Treatment with dipyridamole plus aspirin significantly prolonged the duration of primary unassisted patency (hazard ratio, 0.82; 95% CI, 0.68 to 0.98; P=0.03) and inhibited stenosis. The incidences of cumulative

Effect of Clopidogrel on Early Failure of Arteriovenous Fistulas for Hemodialysis

A Randomized Controlled Trial

Design, Setting, and Participants Randomized, double-blind, placebo-controlled trial conducted at 9 US centers composed of academic and community nephrology practices in 2003-2007. Eight hundred seventy-seven participants with end-stage renal disease or advanced chronic kidney disease were followed up until 150 to 180 days after fistula creation or 30 days after initiation of dialysis, whichever occurred later.

Intervention Participants were randomly assigned to receive clopidogrel (300-mg loading dose followed by daily dose of 75 mg; n = 441) or placebo (n = 436) for 6 weeks starting within 1 day after fistula creation.

Table 2. Fistula Thrombosis

	No. (%) of Patients		
	Clopidogrel (n = 436)[a]	Placebo (n = 431)[a]	Relative Risk (95% Confidence Interval)[b]
Thrombosis at 6 wk (all patients)	53 (12.2)	84 (19.5)	0.63 (0.46-0.97)[c]
By location			
Forearm fistula	31 (12.9)	60 (24.7)	0.53 (0.36-0.77)
Upper arm fistula	22 (11.3)	24 (12.8)	0.89 (0.52-1.53)

[a] Six of the 441 patients randomized to clopidogrel and 5 of the 436 patients randomized to placebo were not included because patency was not evaluated.
[b] Relative risks were stratified for fistula location and center.
[c] The 95% confidence interval reported is the repeated confidence interval adjusted for interim monitoring. The repeated *P* value adjusted for interim monitoring is .016.

Table 4. Adverse Events[a]

	No. (%) of Patients		
Events	Clopidogrel (n = 441)	Placebo (n = 436)	*P* Value[b]
Any serious adverse event	67 (15.2)	81 (18.6)	.20
Bleeding	13 (2.9)	12 (2.8)	.84
Minor	0	0	> .99
Intermediate	6 (1.4)	5 (1.2)	> .99
Major	3 (0.7)	3 (0.7)	> .99
Life-threatening	4 (0.9)	4 (0.9)	> .99
Fatal	0	0	> .99
Hospitalization	64 (14.5)	77 (17.7)	.16
Ischemic heart disease	3 (0.7)	7 (1.6)	.22
Congestive heart failure	6 (1.4)	9 (2.1)	.45
Arrhythmia	1 (0.2)	7 (1.6)	.04
Hypertension	0	5 (1.1)	.03
Cerebrovascular disease	2 (0.5)	1 (0.2)	> .99
Infection	4 (0.9)	3 (0.7)	> .99
Vascular access event: study fistula	5 (1.1)	6 (1.4)	.77
Vascular access event: nonstudy access	15 (3.4)	12 (2.8)	.70
Death	4 (0.9)	4 (0.9)	> .99

J Am Soc Nephrol 14: 2313–2321, 2003

Randomized Controlled Trial of Clopidogrel plus Aspirin to Prevent Hemodialysis Access Graft Thrombosis

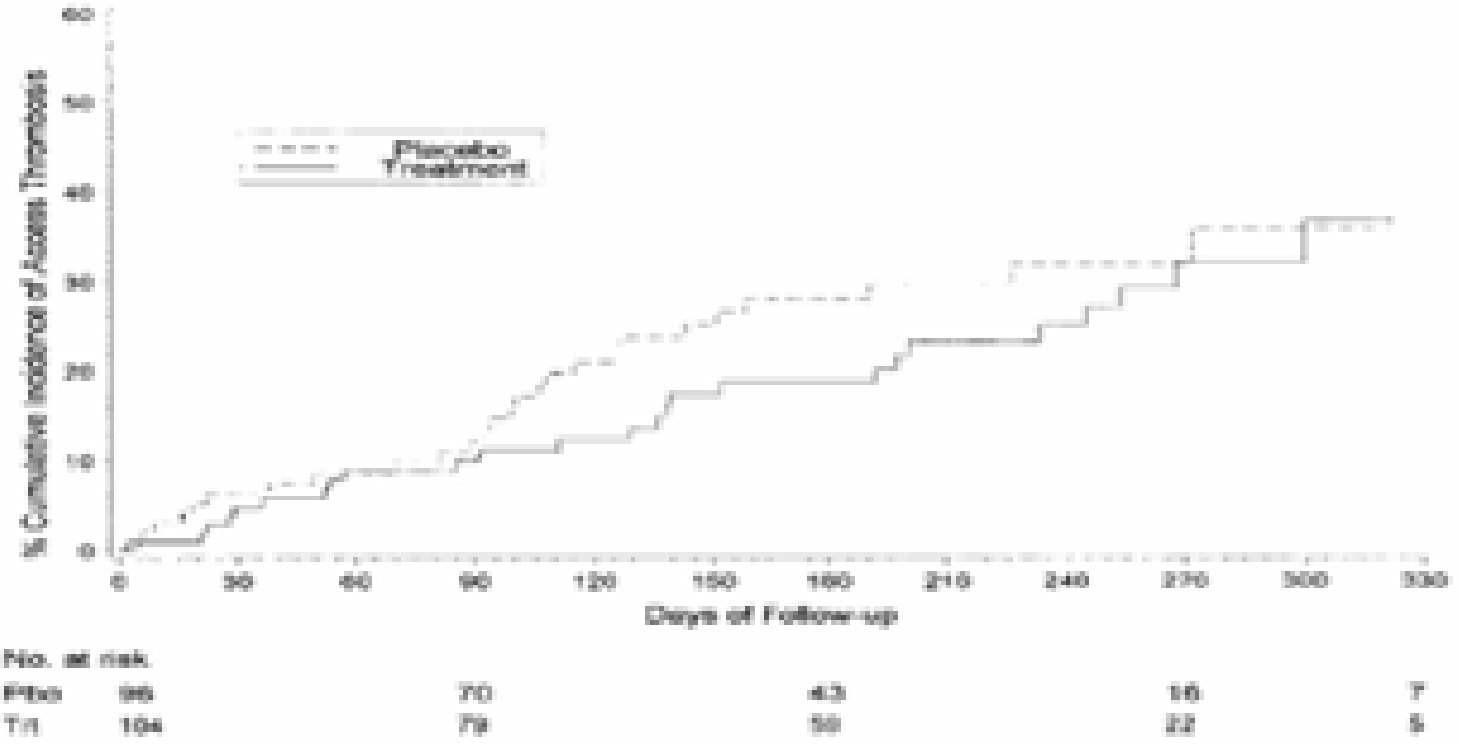

Figure 2. Cumulative incidence of first graft thromboses. The incidences were not significantly different ($P = 0.45$) for the two groups (hazard ratio, 0.81; 95% CI, 0.49 to 1.40). Plbo, placebo; Trt, treatment.

Table 2. Antiplatelet agents and access thrombosis rate in hemodialysis.

Study	Year	Trial (N)	Intervention	Duration (months)	Access thrombosis rate
Dipyridamole:					
Sreedhara[24]	1994	RCT (N = 107)	Dipyridamole 75 mg, aspirin 325 mg, both, placebo Type I: new graft Type II: recurrent thrombosis	72	Type I: 17% vs. 36% vs. 23% vs. 32% Type II: 83% vs. 58% vs. 100% vs. 80%
Dixon[25]	2009	RCT (N = 649)	Dipyridamole 200 mg + aspirin 25 mg vs. placebo	60	40% vs. 42%
Aspirin:					
Kooistra[26]	1994	RCT crossover (N = 133)	Aspirin 30 mg vs. placebo	5	16% (9.4% aspirin vs. 6.3% placebo, NS)
Clopidogrel:					
Tsamaeria[28]	2005	Prospective (N = 24)	Clopidogrel 75 mg vs. an antithrombotic therapy	Until diagnosis of thrombosis	8% vs. 92% (p = 0.001)
Dember[27]	2006	RCT (N = 677)	Clopidogrel (300 mg LD and 75 mg daily) vs. placebo	3 after AVF creation or 1 after dialysis initiation	12.2% vs. 19.3% (p = 0.018)
Kaufman[29]	2003	RCT (N = 300)	Clopidogrel 75 mg + aspirin 325 mg vs. double placebo	24	HR 0.81 (95% CI: 0.47-1.40) in favor of aspirin and clopidogrel therapy. (p = 0.45)

AVF = arteriovenous fistula; CI = confidence interval; HR = hazard ratio; LD = loading dose; MD = maintenance dose; NS = non-significant; RCT = randomized controlled trial.

Sonuç

- **KBY hastalarında kanama eğilimi tromboz eğiliminden daha ciddi bir sorundur**
- **Kardiyak ve damar yolu koruma için AP ajanlar tekli ya da kombinasyon olarak kullanılması mümkündür**
- **AK tedavide kar-zarar oranı dikkatle hesaplanmalı ve indikasyonlar normal popülasyona göre daha dar tutulmalıdır**
